

## Dental Emergencies

<b>Workup</b>	<ul style="list-style-type: none"> <li>• Determine if tooth is primary or permanent</li> <li>• Indication for urgent Dental consult               <ul style="list-style-type: none"> <li>■ Avulsed permanent tooth (after reimplantation whenever possible)                   <ul style="list-style-type: none"> <li>■ Extrusion &gt;3 mm or interfering with bite</li> <li>■ Laterally luxated (displaced) teeth that interfere with bite (if not interfering with bite, will often spontaneously revert)</li> </ul> </li> <li>■ Intruded primary teeth</li> <li>■ Fractured teeth when dental pulp is exposed (bleeding from central core of tooth)</li> <li>■ Suspected dental root or alveolar fracture (e.g. tooth mobility, pain out of proportion when tooth is wiggled)</li> <li>■ Suspected jaw fracture (posterior tooth fracture, jaw tenderness, and/or malocclusion) to obtain panoramic radiographs</li> </ul> </li> <li>• Imaging: consider XR to search for swallowed or buried (in laceration) tooth</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>• Reimplantation (while awaiting arrival of dental team...)               <ul style="list-style-type: none"> <li>■ Avulsed permanent teeth should be reimplanted immediately, ideally within 15 minutes and up to one hour</li> <li>■ Store in cold milk or saliva if unable to reimplant</li> <li>■ Handle the tooth carefully by the crown to prevent damage to the periodontal ligament</li> <li>■ Remove debris by gentle rinsing with saline or tap water; do not attempt to sterilize or scrub the tooth</li> <li>■ Reimplant manually</li> <li>■ Keep the tooth in place by having the child hold it or bite on a gauze pad or clean towel.</li> </ul> </li> <li>• Uncomplicated fracture of permanent tooth:               <ul style="list-style-type: none"> <li>■ Store tooth fragments in tap water to prevent discoloration</li> <li>■ Dental follow-up within a few days to bond fracture piece or smooth a fracture</li> </ul> </li> <li>• Other injuries (infraction, concussion, subluxation) warrant outpatient dental referral</li> <li>• General aftercare               <ul style="list-style-type: none"> <li>■ Soft diet for up to 10 days and limit sucking (pacifier or digit)</li> <li>■ Continue brushing with a soft-bristled toothbrush</li> <li>■ Avoid flossing until healing has occurred</li> <li>■ Chlorhexidine mouthrinse for luxation of permanent teeth</li> <li>■ Tetanus prophylaxis, for dirty wounds, avulsed teeth, deep lacerations, or marked luxation injuries</li> </ul> </li> </ul>

## Epistaxis

<b>Sources</b>	<p>Messner AH. Management of epistaxis in children. In: UpToDate, Post TW (Ed), UpToDate, Waltham, MA. (Accessed on January 25, 2016.)</p> <p>Acknowledgements: Ali Baker</p>
<b>Pathogenesis</b>	<p>The anterior nasal septum is highly vascularized (Kiesselbach's plexus) and is subject to exposure due to location.</p>
<b>Etiology</b>	<ul style="list-style-type: none"> <li>• Trauma (including nose-picking)</li> <li>• Mucosal irritation: allergic rhinitis, viral URI, dry environment</li> <li>• Tumor: nasopharyngeal angiofibroma, pyogenic granuloma, papilloma</li> <li>• Vascular abnormality</li> <li>• Coagulopathy</li> <li>• Inflammatory: Granulomatosis with polyangiitis (GPA), formerly called Wegener's</li> </ul>
<b>Clinical Presentation</b>	<ul style="list-style-type: none"> <li>• Active bleeding or dried blood</li> <li>• Nasal mucosa: may be dry, cracked, pale, boggy, or have prominent vessels</li> <li>• If there is active bleeding, look for vessels involved</li> <li>• Exclude masses, polyps, foreign bodies</li> <li>• Exclude underlying bleeding disorder: ecchymosis, petechiae</li> </ul>
<b>Workup</b>	<p>No studies are routinely required</p> <ul style="list-style-type: none"> <li>• Hematologic and coagulation studies if history suggests personal or family history of bleeding disorder</li> <li>• CT or MRI if malignancy is suspected</li> </ul>
