

Acute Abdominal Pain	
Differential	
<b>GI</b>	Appendicitis, trauma, pancreatitis, intussusception, malrotation ± volvulus, inflammatory bowel disease, gastritis, bowel obstruction, irritable bowel syndrome, abscess, hepatitis, perforated ulcer, Meckel diverticulum, cholecystitis, choledocholithiasis, constipation, gastroenteritis (particularly with associated mesenteric adenitis)
<b>Renal</b>	Urinary tract infection, pyelonephritis, nephrolithiasis
<b>GU</b>	Ectopic pregnancy, ovarian cyst/torsion, tubo-ovarian abscess, pelvic inflammatory disease, testicular torsion
<b>Oncologic</b>	Wilms tumor, neuroblastoma, rhabdomyosarcoma, lymphoma
<b>Other</b>	Henoch-Schonlein purpura, lower lobe pneumonia, sickle cell anemia, diabetic ketoacidosis, juvenile idiopathic arthritis, incarcerated hernia, Streptococcal pharyngitis
Workup	
<b>History</b>	Course and characterization, diarrhea, emesis, melena, hematochezia, fever, last oral intake, menstrual history, vaginal symptoms, urinary symptoms, respiratory symptoms, travel history, diet, pertinent family history
<b>PE</b>	<ul style="list-style-type: none"> <li>• Vital signs, toxic appearance, rashes, arthritis, jaundice</li> <li>• Thorough abdominal exam (if concern for appendicitis, check for psoas sign, obturator, Rovsing's)</li> <li>• Rectal exam with stool Hemocult</li> <li>• Bimanual exam in sexually active females</li> <li>• Genital exam</li> </ul>
<b>Studies</b>	<ul style="list-style-type: none"> <li>• KUB to assess for obstruction, constipation, free air, gallstones</li> <li>• Abdominal/pelvic ultrasound</li> <li>• Consider abdominal CT</li> <li>• Pelvic MRI for appendicitis if institutionally available</li> </ul>
<b>Labs</b>	<ul style="list-style-type: none"> <li>• Laboratory studies</li> <li>• CBC, chemistry, electrolytes, liver and kidney function, ESR, CRP, amylase, lipase, gonorrhea/Chlamydia, urine pregnancy</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>• NPO, fluids</li> <li>• "GI cocktail" - multiple antacids</li> <li>• Consider nasogastric decompression</li> <li>• Serial abdominal exams</li> <li>• Surgical/gynecologic/GI evaluation</li> <li>• Pain control and antibiotics as indicated</li> </ul>

Blunt Abdominal Trauma	
<b>Sources</b>	BCH EBG (Trauma, abdominal), <b>CHOP Clinical Pathway</b> , Fleisher GR, Ludwig S, eds. (2010) Textbook of Pediatric Emergency Medicine. 6 <sup>th</sup> ed. Philadelphia: Lippincott Williams & Wilkins.
<b>Assessment</b>	<ol style="list-style-type: none"> <li>1. Abdominal wall abrasion, erythema, ecchymosis or seat belt sign</li> <li>2. Any abdominal tenderness/pain</li> <li>3. Evidence of thoracic wall trauma</li> <li>4. Absent or decreased breath sounds</li> </ol>
<b>If #1 or &gt;2 of the above present</b>	<ul style="list-style-type: none"> <li>• FAST assessment limited compared to adults</li> <li>• Abdominal CT with IV contrast</li> <li>• Labs: CBC, LFTs, lipase, UA, type and screen</li> <li>• Surgical consult</li> </ul>

Abdominal Trauma continued on next page →

### Blunt Abdominal Trauma

<b>Treatment</b>	<ul style="list-style-type: none"> <li>Any traumatic findings: admit to trauma surgery service</li> <li>No traumatic findings: observe 4 hrs after CT, reevaluate including: PO challenge, vital signs, repeat abdominal/thoracic exams</li> <li>If symptoms worsening, consider imaging</li> <li>If symptoms improved, discharge to home with return instructions</li> </ul>
------------------	---

### Appendicitis

<b>Sources</b>	BCH EBG (appendicitis), CHOP Clinical Pathway
<b>Definition</b>	Inflammation of the appendix caused by obstruction of the lumen
<b>Patho</b>	<ul style="list-style-type: none"> <li>The appendix is a blind pouch in the RLQ that can become obstructed with a fecalith or lymph tissue. Once it becomes obstructed, it becomes inflamed and edematous which eventually leads to necrosis and perforation.</li> <li>Inflammation can also occur as a result of bacterial invasion without obstruction.</li> </ul>
<b>Clinical</b>	<ul style="list-style-type: none"> <li>Pain begins in periumbilical region (referred pain) and then moves to RLQ</li> <li>Anorexia, nausea, vomiting, and fever</li> <li>Young children may not have classic signs and therefore many present with perforation!</li> <li>Perforation will occur between 24-48 hours after symptom onset if not diagnosed. <ul style="list-style-type: none"> <li>Perforation can present with high fevers and peritoneal signs</li> </ul> </li> </ul>
<b>Physical Exam</b>	<ul style="list-style-type: none"> <li>Pain on palpation in periumbilical region that migrates to RLQ</li> <li>Rovsing's sign: palpation of LLQ causes pain in RLQ</li> <li>Psoas sign: increased abdominal pain when patient flexes right hip against resistance</li> <li>Obturator sign: increased abdominal pain when patient's right leg is raised with knee flexed and then internally rotated at the hip.</li> <li>Rectal exam: may have tenderness if have retrocecal appendix.</li> <li>If perforated: guarding and/or rebound</li> </ul>
<b>Studies</b>	<ul style="list-style-type: none"> <li>If female, obtain urine HCG</li> <li>CBC: poly-predominant leukocytosis is strongly associated with appendicitis</li> <li>UA may show mild pyuria</li> <li>KUB: not indicated in most. may show fecalith, localized ileus, free air (if perforated), SBO in young child without prior surgical history is appendicitis unless proven otherwise</li> <li>Start with US: <ul style="list-style-type: none"> <li>US: increased diameter, thickened wall, echogenicity surrounding appendix, appendicolith. Interpretation heavily influenced by pre-test probability.</li> <li>CT with IV contrast or MRI: increased diameter, fat streaking</li> </ul> </li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>NPO</li> <li>Consult surgery</li> <li>IV antibiotics: Zosyn. If allergic to penicillin: Clindamycin + Gentamicin</li> <li>Urgent appendectomy</li> <li>If perforated: antibiotics with interval appendectomy</li> </ul>
