

Nephrotic Syndrome	
Exam	Edema, hypertension, assess for extra-renal findings that may suggest a secondary cause for nephrotic syndrome (e.g. infection)
Diagnostic Studies	<ul style="list-style-type: none"> • Chem 10; C3; see also section on proteinuria • UA + 24 hour urine collection >3 grams/day OR spot Ur prot:Cr ratio > 2 (normal <0.2) • Consider renal biopsy for diagnosis (see below)
Treatment	<ul style="list-style-type: none"> • Empiric steroids for presumed minimal change disease (if persistent past 1-2 wk) <ul style="list-style-type: none"> ■ Prednisone 60 mg/m²/day (max 60 mg/day) for 4 weeks ■ Then prednisone 40 mg/m²/day QOD for 4 weeks w/ gradual taper, generally for minimum total 2-3 months • Consider biopsy if steroid resistant, steroid-dependent, or evidence of steroid toxicity <ul style="list-style-type: none"> ■ In minimal change, see normal light microscopy but on EM there is diffuse foot process effacement • ACE inhibitors or ARBs are preferred for BP control (decrease glomerular pressure, → decreased protein filtration) <ul style="list-style-type: none"> ■ e.g., enalapril 0.08 mg/kg per day (maximum of 5 mg/day), titrate to maximum dose of 0.6 mg/kg per day (maximum of 40 mg/day) re: BP response ■ Use with caution for GFR <60 mL/min/1.73 m² ■ Re-check serum Cr, K 3-5 days after starting ACEI/ARB • Edema - salt restriction (< 2 mEq/kg/day) and diuretics: <ul style="list-style-type: none"> ■ if intravascular volume normal (FeNa >2%) - furosemide 1-2 mg/kg/dose x2 doses ■ If intravascular volume low (FeNa <2%) and edema is severe (anasarca, pleural effusions, ascites): <ul style="list-style-type: none"> • Albumin 25% 1 gram/kg IV over 4 hours • Give 1 mg/kg IV lasix at the 2 hour point • Give 1 mg/kg IV lasix after albumin infusion • Consider prophylactic anticoagulation if high-risk (age >12, albumin <2, fibrinogen >6) • Treat VTE if present with LMWH • Consider statin for HLD, especially if other ASCVD risk factors are present

Acute Kidney Injury																
Definition	Acute decrease in GFR per KDIGO criteria:															
	<table><tr><th colspan="3">Table 2 Staging of AKI</th></tr><tr><th>Stage</th><th>Serum creatinine</th><th>Urine output</th></tr><tr><td>1</td><td>1.5–1.9 times baseline OR ≥ 0.3 mg/dl (≥ 26.5 μmol/l) increase</td><td>< 0.5 ml/kg/h for 6–12 hours</td></tr><tr><td>2</td><td>2.0–2.9 times baseline</td><td>< 0.5 ml/kg/h for ≥ 12 hours</td></tr><tr><td>3</td><td>3.0 times baseline OR Increase in serum creatinine to ≥ 4.0 mg/dl (≥ 353.6 μmol/l) OR Initiation of renal replacement therapy OR, In patients < 18 years, decrease in eGFR to < 35 ml/min per 1.73 m²</td><td>< 0.3 ml/kg/h for ≥ 24 hours OR Anuria for ≥ 12 hours</td></tr></table>		Table 2 Staging of AKI			Stage	Serum creatinine	Urine output	1	1.5–1.9 times baseline OR ≥ 0.3 mg/dl (≥ 26.5 μmol/l) increase	< 0.5 ml/kg/h for 6–12 hours	2	2.0–2.9 times baseline	< 0.5 ml/kg/h for ≥ 12 hours	3	3.0 times baseline OR Increase in serum creatinine to ≥ 4.0 mg/dl (≥ 353.6 μmol/l) OR Initiation of renal replacement therapy OR, In patients < 18 years, decrease in eGFR to < 35 ml/min per 1.73 m ²
Table 2 Staging of AKI																
Stage	Serum creatinine	Urine output														
1	1.5–1.9 times baseline OR ≥ 0.3 mg/dl (≥ 26.5 μmol/l) increase	< 0.5 ml/kg/h for 6–12 hours														
2	2.0–2.9 times baseline	< 0.5 ml/kg/h for ≥ 12 hours														
3	3.0 times baseline OR Increase in serum creatinine to ≥ 4.0 mg/dl (≥ 353.6 μmol/l) OR Initiation of renal replacement therapy OR, In patients < 18 years, decrease in eGFR to < 35 ml/min per 1.73 m ²	< 0.3 ml/kg/h for ≥ 24 hours OR Anuria for ≥ 12 hours														
Etiology	<p>Pre-Renal: decreased renal perfusion</p> <ul style="list-style-type: none">• Decreased intravascular volume: dehydration, blood loss• Decreased effective circulating volume: shock, heart failure, cirrhosis <p>Renal: intrinsic renal parenchymal disease</p> <ul style="list-style-type: none">• Glomerular disease: glomerulonephritis, nephrotic disorders• Vascular: vasculitis• Tubulointerstitial: ATN (ischemia/progression of pre-renal AKI, aminoglycosides, myoglobin, uric acid in tumor lysis syndrome), interstitial nephritis (NSAIDs, penicillins) <p>Post-Renal: obstructive uropathy (posterior urethral valves, tumor, large stones, etc). Needs to be bilateral compression to develop renal failure in a patient with otherwise normal kidneys.</p>															
Clinical Manifestations	<ul style="list-style-type: none">• Fluid retention: edema, decreased urine output• Hematuria with intrinsic kidney injury (glomerulonephritis, ATN)• Uremia: nausea/vomiting, GI bleeding, pericarditis, pruritus, mental status change

Nephrology

Acute Kidney Injury	
Exam	Look for hypertension and edema (periorbital and peripheral)
Diagnostic Studies	<ul style="list-style-type: none"> • UA: <ul style="list-style-type: none"> ■ Hematuria, proteinuria, red cell casts suggests glomerulonephritis ■ Muddy brown casts suggests ATN ■ Urine eosinophils suggests acute interstitial nephritis (not a great test, may be positive even if only 1 eosinophil) • Urine electrolytes to calculate fractional excretion sodium (FENa) <ul style="list-style-type: none"> ■ $FENa = (UNa \times PCr) / (PNa \times UCr)$ ■ FENa <1% suggests prerenal; FENa >2% suggests intrarenal • Chem 10 • CBC/diff • Consider CK if history suggestive of rhabdomyolysis • Renal US to look for hydronephrosis, obstructive uropathy, renal scarring
Treatment	<ul style="list-style-type: none"> • Correct associated electrolyte issues (hyperkalemia, hyponatremia, hypocalcemia, acidosis) • Manage hypertension (see section below) • Fluid management <ul style="list-style-type: none"> ■ Small NS bolus (5-10 cc/kg) if hypovolemic or in pre-renal failure ■ Reassess volume status and continue to give small boluses until patient is euvolemic ■ Replace insensible losses plus 1:1 urine/stool output ■ Insensible losses = 300 cc/m²/day ■ $BSA = \text{square root of } [(ht \text{ cm} \times wt \text{ kg}) / 3600]$ • Indications for dialysis: AEIOU <ul style="list-style-type: none"> ■ Acidosis ■ Electrolyte anomalies refractory to medical management (hyperK/Phos) ■ Ingestions (Li, ASA) ■ Overload ■ Uremia (pericarditis, encephalopathy)

Chronic Kidney Disease	
Definition	<ul style="list-style-type: none"> • Irreversible kidney damage and reduction in kidney function; may be progressive • Requires 1 of 2 of the following (2012 KDIGO Clinical Practice Guideline); ages 2+: <ul style="list-style-type: none"> ■ GFR < 60 mL/1.73 m² for > 3 mo ■ GFR > 60 mL/1.73 m² alongside evidence of structural kidney damage or other marker of abnormal renal function (proteinuria, albuminuria, renal tubular d/o) ■ For kids <2 → GFR <1 std dev below mean = mod dysfunction, <2 std dev = severe • Severity stratified by GFR from G1 (normal, ≥90) → G2 (60-89) → G3a (45-59) → G3b (30-44) → G4 (15-29) → G5 (<15) = ESRD / dialysis-dependence
Etiology	<ul style="list-style-type: none"> • Congenital causes (renal aplasia, reflux, PKD, obstructive uropathy) in ~60% • Glomerular disease (FSGS, membranous nephropathy, MPGN, SLE nephritis, etc.) • Other: HUS, Alport syndrome, cystinosis, interstitial nephritis, tumors
Pathophysiology	Multiple possible insults leading to intraglomerular HTN and glomerular hypertrophy → nephron loss → hyperfiltration in remaining nephrons → further glomerular damage → glomerulosclerosis, proteinuria, fibrosis
Clinical Manifestations	<ul style="list-style-type: none"> • Edema + HTN • Proteinuria / hypoalbuminemia • Anemia (due to EPO deficiency) • Dyslipidemia / accelerated ASCVD • Vitamin D deficiency with secondary hyperparathyroidism • Electrolyte derangements: hyperkalemia, hyperphosphatemia, hypocalcemia, metabolic acidosis • Growth failure, delayed puberty, and intellectual disability • Complications of uremia: pericarditis, platelet dysfunction, encephalopathy
