

## Nephrology

Hyperkalemia	
<b>Workup</b>	Chem 10 (ensure not hemolyzed -- free-flowing sample, order STAT), blood gas to assess acid/base status, EKG, TTKG (see above) -- low TTKG (<7) in setting of hyperkalemia may indicate ald deficiency or resistance, plasma renin and aldosterone.
<b>Management</b>	<p>If real and w/ EKG changes</p> <p>STOP K+ supplementation, K+-containing IVF, and K+-sparing medications</p> <p><b>Stabilize cardiac membrane: calcium gluconate</b> 10% @ 0.5 mL/kg (=100 mg/kg) IV over 5</p> <p><b>calcium chloride</b> 20 mg/kg IV over 5-10 min if impending cardiac arrest</p> <p><b>Drive K+ into cells</b></p> <p><b>insulin</b> 0.1 U/kg, max 10U IV with glucose: &lt;5 yo: D10 (100 mg/mL) @ 5 mL/kg // ≥5 yo: D25 (250 mg/mL) @ 2-4 mL/kg IV (max 25g), infuse over 30 min</p> <p><b>albuterol nebs:</b> neonates 0.4 mg in 2 mL NS // &lt; 25 kg, 2.5 mg in 2 mL NS // 25-50 kg: 5 mg in 2 mL NS // &gt;50 kg: 10 mg in 2-4 mL NS or 4-8 MDI puffs</p> <p><b>bicarb:</b> 1 mEq/kg IV (max 50 mEq) over 10-15 min (&lt; 6 mo: 2 mL/kg of 4.2% NaHCO3 // ≥ 6 mo: 1 mL/kg of 8.4% NaHCO3)</p> <p><b>intubate + hyperventilate</b> (induce alkalosis)</p> <p><b>Excrete total body K+</b></p> <p><b>Kayexalate</b> (1 g/kg, max 50g PO/PR q4h PRN)</p> <p><b>Furosemide</b> 1-2 mg/kg IV (max 40 mg or 80 mg if renal insufficiency) q6h PRN</p> <p><b>Dialysis</b> if emergent or if ongoing source of K+ release (tumor lysis, rhabdo)</p>

Hematuria	
<b>Definition</b>	Red blood cells in the urine
<b>Etiology</b>	<ul style="list-style-type: none"> <li>• <b>Extra-glomerular:</b> UTI, ureteral trauma, nephrolithiasis, cystitis (any UTI, adenovirus, cyclophosphamide), sickle cell disease or trait, malignancy (bladder CA, Wilms tumor)</li> <li>• <b>Intra-glomerular:</b> glomerulonephritis (see GN section), benign familial hematuria / thin basement membrane disease</li> </ul>
<b>Workup</b>	<ul style="list-style-type: none"> <li>• UA (+blood on dip AND +RBCs on micro?)</li> <li>• If only +blood, think myoglobin vs hemoglobin</li> <li>• If red but neg blood/neg RBC, think beets, rifampin, nitrofurantoin, doxorubicin, chloroquine</li> <li>• If cola- or tea-colored urine, RBC casts, marked proteinuria, or dysmorphic RBCs, think GN</li> <li>• If blood clots, uniform RBCs, urethral bleeding, think extra-gl.)</li> <li>• If h/o trauma, do CTAP</li> <li>• If s/sx UTI, do Ucx</li> <li>• If s/sx nephrolithiasis, do renal US +/- CTAP</li> <li>• If c/f GN, send chem 10, CBC/d/retic, C3/C4, albumin, ASLO, anti-DNase B, ANA, urine protein:Cr ratio; consider renal bx if concomitant proteinuria/HTN and/or rising serum creatinine</li> </ul>

Proteinuria	
<b>Definition</b>	<ul style="list-style-type: none"> <li>• Excessive excretion of urinary protein</li> <li>• <b>Dipstick:</b> estimates as follows: trace = 15-30 mg/dL / 1+ = 30-100 mg/dL / 2+ = 100-300 mg/dL / 3+ = 300-1000 mg/dL / 4+ = &gt;1000 mg/dL</li> <li>• Primarily detects albumin</li> <li>• <b>Quantitative</b> (perform if dip pos): spot urine prot/Cr (nl &lt;0.2 mg if age 2+, &lt;0.5 if &lt;2 yo; 3-3.5 mg/mg = nephrotic) / 24h: &gt;100 mg/m2 per day is abnormal, &gt;1000 mg/m2 per day is nephrotic</li> </ul>

Proteinuria	
Definition	<pre> graph TD     A[UA positive for protein] -- "≥1+" --&gt; B[Obtain first am void for UA and protein/creatinine ratio]     A -- "Trace" --&gt; C[Repeat UA on first am void in one year]     B -- "Normal UA and Prot/Cr ratio ≤ 0.2" --&gt; C     B -- "Abnormal UA or Prot/Cr ratio &gt;0.2" --&gt; D["• Detailed H+P including BP • Chem 10, albumin, cholesterol Consider: • Renal US • C3, C4, ANA • Hepatitis B and C serologies • HIV testing • Renal Biopsy"]           </pre>
Etiology	<ul style="list-style-type: none"> <li>• <b>Glomerular</b> (inc filtration of macromolecules, esp albumin -- may be <b>transient</b> [fever, exercise, stress, seizures, resolves on rpt testing after stressor gone] vs <b>orthostatic</b> [present when standing and not when supine - first morning void] vs <b>persistent</b> [elevated on both supine/upright voids])</li> <li>• <b>Tubular</b> (inc excretion of <b>low molecular weight proteins</b>, esp beta-2-microglobulin, that are normally filtered in the glomerulus and reabsorbed in the proximal tubule -- may be d/t congenital disorders of proximal tubule [Fanconi syndrome, cystinosis, galactosemia, Lowe syndrome] or with acute tubular injury [ATN, AIN, pyelo])</li> <li>• <b>Overflow</b> (inc excretion of low molecular weight proteins d/t protein overproduction [multiple myeloma, myoglobin in rhabdomyolysis] .</li> </ul>
Presentation	<ul style="list-style-type: none"> <li>• If significant quantity, protein will be frothy; otherwise varies with cause</li> <li>• If nephrotic, may have edema/HTN, may have stigmata of primary dx (oral ulcers, rash, and joint swelling in SLE; abdominal pain and palpable purpura in HSP; h/o recurrent UTIs with VUR, hepatitis and movement d/o in Wilson dz)</li> </ul>

Nephritic Syndrome	
Definition	Any of several conditions leading to glomerular hematuria, proteinuria, and potential AKI with azotemia/oliguria, edema, and hypertension.
Etiology	<ul style="list-style-type: none"> <li>• Post infectious: <ul style="list-style-type: none"> <li>■ <b>Group A beta hemolytic strep</b>, either after pharyngitis or impetigo</li> <li>■ Other infections: staph aureus/epi, pneumococcus, mycoplasma, viral</li> </ul> </li> <li>• IgA Nephropathy (most common glomerulopathy worldwide)</li> <li>• SLE Nephritis</li> <li>• <b>Membranoproliferative GN</b>: can be idiopathic or secondary to HBV/HCV or rheumatologic disease</li> <li>• <b>Alport Syndrome</b>: XLR collagen IV mutations, a/w hearing loss, vision changes</li> <li>• <b>Goodpasture Syndrome</b>: autoAb to Type IV collagen in glomerular and alveolar basement membranes → hemoptysis,</li> <li>• <b>Vasculitis</b>: HSP, granulomatosis with polyangiitis (lung/sinus/kidney), eosinophilic granulomatosis with polyangiitis (asthma/neuropathy/lung/kidney/skin), microscopic polyangiitis (lung/kidney)</li> </ul>
