

Hypocalcemia											
<b>Etiology</b>	<table> <tr> <th colspan="2">Other Causes</th></tr> <tr> <th colspan="2">Neonatal</th></tr> <tr> <td colspan="2"> <ul style="list-style-type: none"> <li>• <b>Maternal Factors:</b> Mother w/ diabetes, Vit D deficiency, AED use, hyperparathyroidism, or eclampsia</li> <li>• <b>Neonatal Factors:</b> low birth weight, prematurity, IUR, asphyxia</li> <li>• Other Illness: sepsis, RDS, hyperbilirubinemia, renal failure</li> </ul> </td></tr> <tr> <th colspan="2">Miscellaneous</th></tr> <tr> <td colspan="2"> <ul style="list-style-type: none"> <li>• <b>Hungry Bone Syndrome:</b> Avid bone mineralization after recovery from severe mineralization defect (e.g., vitamin D deficiency)</li> <li>• <b>Osteopetrosis:</b> oss of osteoclast function</li> <li>• Citrate or Lactate administration (e.g., from blood transfusion)</li> <li>• <b>Pancreatitis:</b> complex formation w/ fatty acids</li> <li>• <b>Drugs:</b> bisphosphonates, foscarnet, chemotherapy</li> </ul> </td></tr> </table>	Other Causes		Neonatal		<ul style="list-style-type: none"> <li>• <b>Maternal Factors:</b> Mother w/ diabetes, Vit D deficiency, AED use, hyperparathyroidism, or eclampsia</li> <li>• <b>Neonatal Factors:</b> low birth weight, prematurity, IUR, asphyxia</li> <li>• Other Illness: sepsis, RDS, hyperbilirubinemia, renal failure</li> </ul>		Miscellaneous		<ul style="list-style-type: none"> <li>• <b>Hungry Bone Syndrome:</b> Avid bone mineralization after recovery from severe mineralization defect (e.g., vitamin D deficiency)</li> <li>• <b>Osteopetrosis:</b> oss of osteoclast function</li> <li>• Citrate or Lactate administration (e.g., from blood transfusion)</li> <li>• <b>Pancreatitis:</b> complex formation w/ fatty acids</li> <li>• <b>Drugs:</b> bisphosphonates, foscarnet, chemotherapy</li> </ul>	
Other Causes											
Neonatal											
<ul style="list-style-type: none"> <li>• <b>Maternal Factors:</b> Mother w/ diabetes, Vit D deficiency, AED use, hyperparathyroidism, or eclampsia</li> <li>• <b>Neonatal Factors:</b> low birth weight, prematurity, IUR, asphyxia</li> <li>• Other Illness: sepsis, RDS, hyperbilirubinemia, renal failure</li> </ul>											
Miscellaneous											
<ul style="list-style-type: none"> <li>• <b>Hungry Bone Syndrome:</b> Avid bone mineralization after recovery from severe mineralization defect (e.g., vitamin D deficiency)</li> <li>• <b>Osteopetrosis:</b> oss of osteoclast function</li> <li>• Citrate or Lactate administration (e.g., from blood transfusion)</li> <li>• <b>Pancreatitis:</b> complex formation w/ fatty acids</li> <li>• <b>Drugs:</b> bisphosphonates, foscarnet, chemotherapy</li> </ul>											
<b>Clinical Manifestations</b>	<p>Acute hypocalcemia</p> <ul style="list-style-type: none"> <li>• Tremor, muscle spasms, paraesthesias, tetany (Chvostek, Trousseau signs)</li> <li>• Seizures</li> <li>• QT prolongation, impaired contractility</li> <li>• Psychiatric symptoms (anxiety, agitation, hallucinations)</li> </ul> <p>Vitamin D deficiency: rickets, muscle weakness, hypotonia, growth retardation</p> <ul style="list-style-type: none"> <li>• Xrays show osteopenia, widening of the metaphysis, cupping/splaying of growth plate, formation of cortical spurs, fractures</li> </ul>										
<b>Diagnostic Studies</b>	<ul style="list-style-type: none"> <li>• Albumin and/or ionized calcium to determine if true hypocalcemia</li> <li>• If hypocalcemia confirmed send PTH, magnesium, phosphate, BUN, creatinine, 25OH-vitamin D</li> </ul>										
<b>Treatment</b>	<ul style="list-style-type: none"> <li>• Calcium salts PO for chronic hypocalcemia</li> <li>• Calcium salts IV for acute hypocalcemia <ul style="list-style-type: none"> <li>■ Ca gluconate 100 mg/kg ( = 1mL/kg of 10% solution)</li> <li>■ CaCl 20 mg/kg ( = 0.2 mL/kg of 10% solution) for emergencies only (irritant, causes necrosis if extravasates)</li> </ul> </li> <li>• Replenish magnesium stores or give vitamin D as appropriate <ul style="list-style-type: none"> <li>■ If initiating treatment for vitamin D deficiency, always give calcium along vitamin D to prevent hypocalcemia from hungry bone syndrome</li> </ul> </li> <li>• In hypoparathyroidism, give 1,25 vitamin D (calcitriol) rather than ergocalciferol/cholecalciferol because of decreased 1<math>\alpha</math>-hydroxylation in the kidney</li> <li>• If hyperphosphatemic, avoid [Ca<sup>+</sup>] X [PO<sub>4</sub>] &gt;55 because of risk of metastatic calcification</li> </ul>										

Hypercalcemia					
<b>Definition</b>	Normal values are age specific and vary between labs				
<b>Etiology</b>	<table> <tr> <th colspan="2">Parathyroid Related</th></tr> <tr> <td colspan="2"> <ul style="list-style-type: none"> <li>• Primary hyperparathyroidism (adenoma or hyperplasia)</li> <li>• Tertiary hyperparathyroidism (only occurs in chronic renal failure)</li> <li>• Familial hypocalciuric hypercalcemia (loss of function CaSR)</li> </ul> </td></tr> </table>	Parathyroid Related		<ul style="list-style-type: none"> <li>• Primary hyperparathyroidism (adenoma or hyperplasia)</li> <li>• Tertiary hyperparathyroidism (only occurs in chronic renal failure)</li> <li>• Familial hypocalciuric hypercalcemia (loss of function CaSR)</li> </ul>	
Parathyroid Related					
<ul style="list-style-type: none"> <li>• Primary hyperparathyroidism (adenoma or hyperplasia)</li> <li>• Tertiary hyperparathyroidism (only occurs in chronic renal failure)</li> <li>• Familial hypocalciuric hypercalcemia (loss of function CaSR)</li> </ul>					

Hypercalcemia	
Etiology	<b>Increased Bone Reabsorption</b>
	<ul style="list-style-type: none"> <li>• Malignancy (metastatic or PTHrP secretion)</li> <li>• Hypervitaminosis A</li> <li>• Hypervitaminosis D</li> <li>• Immobilization</li> </ul>
	<b>Increased 1,25 OHD Production</b>
	<ul style="list-style-type: none"> <li>• Granulomatous disease (sarcoid, tuberculosis)</li> <li>• Subcutaneous fat necrosis in neonates</li> </ul>
	<b>Metabolic Disorders</b>
	<ul style="list-style-type: none"> <li>• Hypophosphatasia (defective alk phos)</li> <li>• Blue diaper syndrome (defect in tryptophan metabolism)</li> <li>• Congenital lactase deficiency</li> </ul>
	<b>Renal Causes</b>
	Thiazide diuretics
	<b>Other</b>
	Adrenal insufficiency, Williams syndrome, thyrotoxicosis, milk alkali syndrome, excess calcium intake, ECMO (mechanism not well understood but thought to be secondary to incr PTH)
Clinical Manifestations	<p><b>“Stones, bones, moans, psychiatric overtones”</b></p> <ul style="list-style-type: none"> <li>• <b>Renal symptoms:</b> polyuria, renal stones, nephrocalcinosis</li> <li>• <b>Musculoskeletal system:</b> Bone pain, joint aches</li> <li>• <b>GI system:</b> paralytic ileus, abdominal cramping, constipation, anorexia, vomiting</li> <li>• <b>Nervous system:</b> headache, personality change, proximal muscle weakness</li> <li>• In infants, failure to thrive</li> <li>• W/ severe hypercalcemia (&gt;14 mg/dL) can have lethargy and coma</li> </ul>
Diagnostic Algorithm	<p>*subcutaneous fat necrosis often (not always) has incr 1,25 OHD</p>

Hypercalcemia continued on next page →

### Hypercalcemia

<b>Treatment</b>	<p>For severe hypercalcemia (&gt;14 mg/dL) and/or symptomatic:</p> <ul style="list-style-type: none"><li>• Increase calcium excretion: IV hydration w/ NS is first line; after hydration, may add, furosemide,</li><li>• Decrease bone resorption: calcitonin: inhibits osteoclast bone resorption, promotes Ca and phos excretion.<ul style="list-style-type: none"><li>■ Calcitonin: inhibits osteoclast bone resorption, promotes Ca and phos excretion.<ul style="list-style-type: none"><li>• Initial dose IM/subq 2-4 units/kg every 12 hours, may increase to 8 units/kg every 12 hours to a max of every 6 hours. Most patients develop tachyphylaxis w/i 48 hours</li></ul></li><li>■ Bisphosphonates: inhibit osteoclast activity. Watch for hypocalcemia; also for hypophos and hypomag.<ul style="list-style-type: none"><li>• Pamidronate dose 0.5-1 mg/kg in children</li></ul></li></ul></li><li>• Primary hyperparathyroidism - parathyroidectomy</li></ul>
------------------	---
